Step 2. Account Balance \$20.

On the 1st of every month I start small. This small account start logic goes with nature as we all know one small seed becomes “Tree” Trees are the ultimate multitaskers of the natural world.They provide a vital lifeline of food and shelter and oxygen for countless insects, mammals and birds, insects. So this definition by me of starting small.

Step 3. Base on Account Balance Order Flow.

We use "PepperStone" as our broker for the same. In case math for \$20 account how I have done compounding step by step "Order Flow"

0.03 lot size we need Est. Buy/Sell Margin \$4.13 below table I have created based on these requirements for going to market. As you see symbol specification max lot size is 100.00 and min 0.01lot where Est Buy/Sell Margin \$1.38. This is how I follow my order.

Let's see how these levels are in real time in play. Using the "R6" Indicator we read the market structure. R6 indicator what it does it will print impulse and retracements/correction. Once Blue Color Line got formed on the chart either side "Bullis/Bearish" next bar as rejection (Hammer, Inverted Hammer, Shooting Star, Morning Star, Evening Star, Engulfing(Bullish/Bearish), Double Top/Bottom(Bullish/Bearish). I place a market or limit orders from these bars. By default the order goes as TP = 20PIPS and SL = 15PIPS. As I am doing these acts manually once my order is in profit I make a safe net bring inside my profit SL as 5PIPS and TP +5PIPS in future to see the example of this order. So this way I am not booking losses in my trade. One level at one time. I do not mix up multiple trades at one time. In case of momentum boost bcoz of news events of the same size order I am punching bcoz price went very fast in one direction.(These news are every day so as an when these events happens that point in time let say I am 10th level during these news events so that point in time my terminal set order size for 0.32 lots just bcoz price going very fast in one direction so I'll be keep punching same size order every 20PIPS)

Real time example here how orders are placed and managed by me in my manual trade.

Let price bearish once I started my day waiting for blue line to formed on the chart on and got rejected candle market order of 0.01 lots with TP = 20PIPS and SL = 15PIPS after 3 or 4 candle price going in my direction of trade which is Bullish I have place Buy order in market as 0.01 lot and I see the profit of \$1 in that case I bring my SL in by 5PIPS wait for one or two candles and then push my TP +5PIPS now my TP is at 25PIPS and SL inside profit as 5PIPS. After 240min in the market I get hit by TP so in this example I have book \$2.50 as 25PIPS.

Now in this example how I am recovering my loss in case any. Let's say from the table below I am on 6th level where I punch order size as 0.11 in case of loss I will go back one level and this time order size 0.09 as I have book loss on my 6th level so I will play 5th level twice and then again go back to order flow.

All these trades I am taking on the M15 chart and bar.

Level	Starting Balance	Percentage Risk	Risk	Profit goal	Pips	Lot size	Ending balance
